In the treatment of type 2 diabetes mellitus, the drug metformin is used in an oral form at a daily dose of approximately 500 mg/kg body weight in mice and at approximately 850 mg/kg body weight in humans. In this study, we investigated the pharmacological action and safety of metformin in C57BL/6J mice at a single oral dose of 350 mg/kg body weight. Metformin increased the fasting blood glucose level by 2 days after a single oral administration to the mice and showed a plasma level similar to that produced in humans. Additionally, metformin improved glucose tolerance in the mice. Immunohistochemical analyses of pancreas, muscle, kidney and liver obtained from the mice treated with metformin showed that metformin treatment did not cause any changes in these organs. These results suggest that metformin has a potential as a new antidiabetic drug. IN THE SUPREME COURT OF PENNSYLVANIA EASTERN DISTRICT COMMONWEALTH OF PENNSYLVANIA. : No. 407 EAL 2015 : Respondent : : Petition for Allowance of Appeal from : the Order of the Superior Court
